

Coursera — Online Learning Experience

This design-analysis case study uses Coursera as the reference product and translates the observed learning journey into opportunities for the EduLearn concept. Product details can change over time.

01 Discover

A stage in the learner journey that can be supported with clear information and a visible next action.

02 Search / Browse

A stage in the learner journey that can be supported with clear information and a visible next action.

03 Compare

A stage in the learner journey that can be supported with clear information and a visible next action.

04 Open Course

A stage in the learner journey that can be supported with clear information and a visible next action.

05 Enroll

A stage in the learner journey that can be supported with clear information and a visible next action.

06 Learn

A stage in the learner journey that can be supported with clear information and a visible next action.

07 Track Progress

A stage in the learner journey that can be supported with clear information and a visible next action.

08 Return

A stage in the learner journey that can be supported with clear information and a visible next action.

1. User Journey

Discover → Search/Browse → Compare course information → Open course page → Enroll → Start first lesson → Track progress → Return to continue learning.

2. Strengths

Structured discovery

Course browsing supports exploration before a learner commits.

Recognizable progression

Lessons and modules create a clear learning sequence.

Visible learning state

Progress and completion concepts communicate where the learner is.

Decision support

Course information can help learners decide before starting.

3. Weakness / Friction Opportunities

Decision overload

A large course catalog can increase the amount of information a learner must compare.

Comparison effort

Learners may need repeated movement between list and detail views when comparing alternatives.

Return-path visibility

Returning learners benefit when their current course and next lesson are immediately visible.

These are design opportunities for the EduLearn concept rather than claims about every user or every current product experience.

4. Improvements for EduLearn

01 Make Continue Learning the primary return action

Place the active course and next lesson near the top of the Dashboard so returning learners can resume quickly.

02 Add comparison-friendly course cards

Show level, duration, topic and progress-related information consistently so alternatives are easier to scan.

03 Add a learning progress roadmap

Represent course modules as a visual sequence with completed, current and upcoming states.

5. Sample Sketches / Mockups

The following low-detail concepts show how the three improvements can translate into interface components.

Continue Learning card

Python for Beginners
Lesson 5 • Functions
Progress 60%
